

MEDIA/STORAGE DEVICES AND ITS FUNCTION

MAGNETIC MEDIA & MAGNETIC STORAGE DEVICES

- Magnetic media uses magnetized particles to store data.
- Magnetic storage devices use magnetic fields to read and write this data.

⚙️ How It Works:

- Data is recorded by magnetizing tiny sections of a surface in a particular direction (representing binary 1s and 0s).
- A read/write head moves across the surface to read (detect polarity) or write (change polarity) data.

EXAMPLES

Magnetic tape

Magnetic disk

OPTICAL MEDIA & OPTICAL STORAGE DEVICES

- Optical media stores data using light patterns (usually created by lasers).
- Optical storage devices read these patterns to retrieve the data.

⚙️ How It Works:

- A laser beam writes data by burning tiny pits into the disc surface or changing dye layers.
- To read data, the laser detects changes in reflectivity caused by the pits and lands (flat areas).

EXAMPLES

DVDs

Blu-Rays

SOLID-STATE MEDIA & SOLID-STATE STORAGE DEVICES

- Solid-state media use flash memory (no moving parts) to store data electronically.
- Solid-state storage devices use this media for fast, durable storage.

⚙️ How It Works:

- Data is stored in flash memory cells that can hold a charge (representing binary data).
- An electronic controller manages reading and writing of the flash memory cell.

EXAMPLES

USB Flash Drives

Solid-State Drive(Storage)
